

### Can AI be a substitute for Humans?

"Humanity is acquiring all the right technology for all the wrong reasons" - R. Buckminster Fuller.

There must be only a very few individuals in the present day world that are unaware about Artificial Intelligence.

Artificial intelligence have significantly improved the human lives over the past few year. Humans continue to make ground breaking and marvellous inventions in field of science

and technology. As a wise man once said: "Any sufficiently developed technology is indistinguishable from magic". AI

will be the most suitable form of technology to depict this said magic. It has been astonishing to watch the modern

day world being changed by the glorious inventions <sup>like</sup> AI.

But is it that glorious enough to be a substitute for humans and human intelligence?

Since the earlier times, Humans were considered as the only form of animals that is capable of reasoning, thinking, making

analysis and progressing emotions. But Nowadays, scientists and technologists have found an alternative that can

perform the functions earlier performed by Humans. This is what termed as Artificial intelligence or AI. So, instead of human brain doing the work, it is performed by collection of chips and microprocessors carefully structured together.

Most of us has used AI atleast once in our life. They started out from modified search engines and progressed into chat GPTs and AI companion. The most expressive form has to be a human-like robot called Samantha developed in UK. Even though AI makes live easier by giving opinions, instructions and companionship, is it that efficient? # Is it trust worthy?

Even though the developers claim that AI is ~~possible~~ capable of thinking and responding like humans without an input, they for sure aren't capable of expressing or perceiving human feelings. Humans are nurtured over generations by their tradition and culture, humans abide by laws and are capable of expressing feelings like patriotism, brotherhood or simple motherly love. AI on the other hand were created

by humans for their personal benefits. AI can perhaps solve a complex mathematical expression ~~effortlessly~~ which may appear puzzling to men ~~effortlessly~~ but they can't run a nation or create a community.

We have often heard of the statement that AI is the future of tomorrow. But it is not logically and philosophically possible that AI could replace humans in all fields. AI may make an excellent accountant or a reasonably good doctor. But there are ~~many~~ ~~values~~ numerous fields both professionally and socially ~~that~~ that are impossible for artificial intelligence to perform. The main reason would be that they were created by humans themselves. AI is supposed to <sup>be</sup> a system that is operated by and controlled by humans.

AI's lack of efficiency will be mainly due to the absence of moral values. Humans are used to abiding by customs of society and social ethics. Meanwhile, AI does not exhibit any moral values of their own. AI may have a brain

They can use to th similar to humans that is capable of thinking, but they do not have a heart like humans that can care.

What makes humans different from animals, is that they have certain ethics and personal interests and ideas. This is also the major difference between humans and artificial intelligence.

It has also been said that, AI which were created for human benefits were used against humans themselves. AI generates ideas that may be even harmful to the human society, even though AI generated cameras, images and other facilities have been a boon to the society, they have also caused <sup>many</sup> ~~many~~ problems. Just like everything, AI also has its own ~~boon's~~ ~~merits~~ and good days and bad days.

The term ethics refers to ideologies, qualities, manners and rules that are of personal interests. AI do not have any Ethics of their own. Sure, we could program them to love and care like us, but how far is our technology that has developed?

Humans have been controlled and subdued by other humans.

This has been a common trend seen in countries like India and South Africa ~~since~~ ~~at~~ till late 1900's. But can

you imagine living in a world ruled by human made

AI? AI Artificial intelligence is simply a something that

has been created by humans for assisting them. However

people treat them as powerful entities that is capable of ruling and running a nation.

In a world prevailed by powerful entities like AI, it is difficult for humans to remain like their old self.

The ~~the~~ great Socrates once said: "The only good is knowledge and the only <sup>evil</sup> ~~bad~~ is ignorance". Even though AI is one

of the inexhaustible forms of knowledge, it has simply made humans ignorant. Earlier when humans had doubts,

they ~~&~~ would turn to books for resources. Now resources

have ~~to~~ are available at our finger tips or sometimes just

an order given by voice. AI and other technology have made

humans ~~stazy~~ and lazy in their academics and profession.

AI have vastly affected human thought process and ideas. AI have prompted us to think differently. It has changed our ~~beliefs~~ beliefs and pushed us towards things that we were earlier unaware of. Change is good. But is it always good? AI have affected human ethics and have lethered us from our currations of beliefs.

It ~~has~~ has made us question things that we previously believed in. One major ~~prob~~ demerit of AI ~~has~~ is that, it have made the society shrink. Youth today are ~~extro~~ engrossed in their own personal cocoon. Humans become emotionless due to the lack of real life social interactions. <sup>individuals</sup> ~~Human~~ are losing their own intrests and have goals that are famous in the society.

While AI is becoming more and more human, actual humans are turning into robots. People are so dependant on technology and social media that our inividual thoughts are becoming indistinguishable from the socidies. people tends to express less emotions towards peers due to their over engrossment with ~~to~~ AI and technology in general.

Another, bad quality of technology, that needs to be highlighted is that ~~they~~ it misused by the ~~the~~ people. AI has been used for all sorts of malpractices including social trolls, ~~hate~~ and many more. AI's smart features are misused to create conflicts that may even be dangerous. So "it is not faith in technology but the faith in humanity that matters." [quoted from Andrew brown]. Humans use AI against one another for ~~was~~ waging wars.

The statistics over the past few years clearly indicates the economical benefits and changes that are supported by AI and other forms of technology. But what needs to be considered is its influence on humanity and society. It is common ~~the~~ fact that countries care more about the economical benefits and development. They ~~may~~ <sup>will surely</sup> support important pioneers like AI that have made this development process smarter, faster and progressive. But is it also necessary to ensure that it is efficient. It is requiring that we question whether it is ~~the~~ helpful? is it ethical?

Before we proclaim something as beneficial, we must consider

Item Code: 945.....

all their qualities. Surely, the good qualities of AI prevail over the bad ones. ~~But however~~ nevertheless it is important that we should keep in our mind, the influence and power it have over ourselves. As ~~it has~~ mentioned earlier, AI does not abide by human ethics.

They can't make honest and ~~reasonable~~ suitable decisions like we can. They can surely make logically reasoned judgements but not ones that ~~are~~ require emotional consultation. There are still numerous things ~~that~~ that cannot yet be tackled by AI. For example, if I were requiring some mental assistance like a therapy, I would very much consider consulting a human therapist ~~than~~ over a AI generated one. It is quite simple really, no matter how advanced the world gets, humans are the only ones that can live as a community and hence create a nation. No matter, how progressive the world can be, humans are going to require real life interactions with other humans: humans who have ethics and emotions.

~~In the end~~, it is ~~only~~ p

~~to~~ Present day world, is attended day by day by technologies. for better or for worse? It is nearly impossible to answer this question we can only measure this in the terms of human response to these

Changes. Humans remain different from other living and non-living things due to ~~our~~ ability humanity. a feature exclusive to humans, even though its scarce to witness humanity these days: when a person loses their ethics, humanity and emotion, they become similar to an animal with primal survival instincts. AI can be compared to animals in some aspects, however they are much more knowledgeable and ~~is~~ developed, than animals.

In the end, its only fair to state that, even though AI lacks human features, like ethics and humanity, they will still continue to influence and alter world. ~~They are~~ Their merits cannot be ignored in any aspects. They have ~~made~~ made lives easier and beneficial. ~~to~~ people who can access AI have progressed into a digital generation. ~~It~~ just like every other thing on this planet, AI has its own <sup>advantages.</sup> ~~merits~~ and disadvantages.

"For some people, technology is so big enough to be a substitute for life" - Adawre Hureby.
