

Modern Technological development and Human values

Independent India made remarkable achievements in technology. Technology plays a very important role in the modernization of the country and human interface. The progress in the scientific and technological sector had made tremendous results in the life of human beings. The technological intervention are very useful in the social, economic, political development of human life. Recent technological development make an incredible result. The students get an agency and curiosity to being involved into technologies and to develop the the country. Each and every inventions of technology like, software, smart phones, Internet etc made the life of students and people easier.

The major achievement of technology was the internet. Internet has opened up a new world before the people and it had carried their mind. Smart phones made a significant role in modernizing the people. Technology had made the communication of people lot more easier than before. Many people believes the smart phones are a very powerful

gift from god. Technological progress are improving the standard of living of people. With a ³ information are within a button press away. "Necessity is the mother invention" - is a famous quote that we are hearing. When there is necessity face anything in the world technological development occurs. For humans beings, they are appreciating the technological progresses, their opinion is that it will increase the human relationship more faster. With the touch of a button, we could see our loved one, wherever be they. According to my opinion it is a grace that our country are improving our living by the development of the technology.

Through technological development, we can know about anything, anywhere in the world. It is a weapon and stepping stone for students to being educated. The improvement of one's nation "Technologically" is an inspiration for a growing citizen. In earlier school days, the education was limited to a classroom with teacher and students. But the thing had changed ~~for~~ now. Students are able to know more about studies with the help of

technology. The children of today's generation are very brilliant, adventure spirited and curiosities enriched. It is a colory for our nation to have a wonderful generation. Techno. It had been possible only through the technological aspects.

The famous scientists such as Homi J. Bhabha, S.N. Basu, C.V. Raman, Vikram Sarabhai made tremendous achievements in science and technology. H.J. Bhabha was the head of Tata Institute of Research centre and atomic energy commission. It is the main brain of these stalwart, our India made tremendous achievements in technology and they are the gifted personalities for our nation.

With the new technologies, we had entered into a new era of space research. 'Chandrayaan' and 'Mangalyaan' are ~~on~~ ^{on the} pride of our nation. It had made communication more effective and many uses for us. We had made tremendous achievements in missile technology. Dr. A.P.J. Abdul Kalam, on Raja Ramanna was in heat with this.

Technological progress are playing relevant role in our life. We are able to

know about new product available on the market, help us to purchase anything at anywhere of our choice, whether it any home products or anything. The students are able to understand the best schools, colleges and other educational institutions that is best suited to them. Thus, the technological progress is playing a relevant role in human lives. The facilities we see around us such as railway stations, airports, metros etc are the result of our development in this sector. The major aim of the technological progress was to eradicate the taboos and myths from the mind of people. Technology had freed everything. It is the foresightness of our nation makers that we attained such a development. Technology serves people with lots and lots of new things that were really needed for them.

'Women Empowerment' had also made possible through our technological development. The facilities in hospitals, markets, shopping strings are example for such things. If any atrocities are done against women, the cyber will be informed, such that they will take

necessary actions against that. Thus the emancipation of women are made possible through such developments.

"There will be no change in the welfare of nation, unless the conditions of women are improved; a bird cannot fly with a single wing" - is the quote

of Swami Vivekanandar. Aiming at this our nation made achievements in the empowerment of women. As a developing country, India has been trying to achieve best in the technological progress to reach as a developed country.

The main reason for making development in the technology is for eradicating the poverty, then only a nation will be development.

Our country had earlierly started the inventions. The 'car' and 'wheel' was first invented by us. It had made entire change in transportation facilities and livestock development. Beginning from small, small inventions now we had entered a new world of technology. Technology is being possible through such a progress. Now, there is no need to go to universities and colleges for gaining education. The students can use the

technology and study well by communicating with their teachers. The teacher or professor will send the study material and inform about the centre of examination. Through these facilities, the children who had been suffering from diseases could also be educated. Through technological development had opened a way to overcome all the issues, whether it is the mental or physical retardation. The best example is the "Stephen William Hawking". Hawking with the help of his wheel chair made great achievements and inventions regarding 'black hole'. It was with the help of his brain and the modern technological wheelchair that helped him to do so.

Technology had developed tremendously, with a single touch itself, we can control anything around us.

Didnt we think out the other side of this technological progress. Anything that is vastly expanded has both positive and negatives. Many people think that social media is a boom and technological developments are boon to a society. The most important development of the technology had it benefited,

with the increasing of employment opportunities around us. But don't we hear about the negative side of the technological progress. Since we have developed much, the development will surely lead to the destruction of humanity. Hawkins had predicted that, "there will be a time when the machines will rule the country". It is clear the the robots, those having extraordinary powers will surely one day rule the world. Recently in newspapers, we had seen that a country had made a robot as the new reader. He can read news continuously without any stopping. Many arguments were developed based on this, but the company which established this robot said that it will decrease the cost of development. But don't you think it is good for a society? If the robots and machines are developed widely, then what will be need of humans. The gift of robots, which are considered as the gift of technology will overrule. This will not be the future, when the human being living like this. Humans are condition continue like this. Humans are digging their place for graves? They are not

aware of what's going to happen. Their development have been made only to make the life of human beings more easier and luxurious. But such a development will surely pose harm on human race. This will ~~also~~ increase, the unemployment, poverty, food shortage etc.

The ^{countries} "world" of competing each other to attain the best development whether it is technologically or anything. The only thought in everyone's mind is the achievement. Technology surely has two effects on humans and society. One is direct and positively while other is indirect and negatively. One must say then and more forward. Our nation had become one of the developing nation. Surely it is the result in the technological development. The improvement in technology had made progress in the hospital facilities, banking, transportation and E. governance. Technology had made new equipments and developed in medicine, such as equipments for surgery, scans and medicines. Transportation had become easily and the people are travelling by under the oceans and sea. Technology helps in the

exploring of people in various spheres. Now the people had reached the moon with the help of technology. These progress in the technology is improving the curiosity among the children to identify things and invent new things.

Technology and Technocrats made education an easy thing. Now the with of technology students are gaining deep information in one thing & even though that is unknown earlier. The youth of this generation is very active in this sphere and ready to do anything. The children had involved in many things, whether it is academically or through other talents. They ~~do~~ are very sure that they can seek help from the technology. ~~now~~ Then ~~now~~ In the big hospitals, small and educational institutions etc we see are set up being build by changing forest, field and other villages. So don't we think it is ~~go~~ really good? No surely, because the increase in the development ~~and~~ are also dangerous to the environment. Be human beings are selfish, we only thinks ~~at~~ about benefit. The large industries, the multinational hospitals, the chemical

factories are built up for the easy faster production of things and for the betterment of the human race. But the heavy wastes from these buildings are poured on the rivers, small ponds, oceans. This will surely affect the flora and fauna. We are not aware about this. What is happening to the world? We are sinking in the pond of development.

Like the negative sides, it also has positive sides. The big technological facilities available in the hospital was very necessary in the hospital for saving one's life. Nothing is more important than life. So any development in the such sector is surely helpful for us and we will appreciate it. Not only in the medical sector, it had proved the progress in many other sectors including our lifestyle development.

If we think about our days, when there was no technology development, how the people had moved their each and every day. How they struggled for their livelihood. If we far sightedness of Jawaharlal Nehru, an ardent fan of science and technology, for

had made remarkable progress in technology and established several research institutions such as :-

- Institute of scientific and industrial research.
- Institute of medical research.
- Institute of agricultural research.

During these times the world-class engineering was formed and five IIT's formed b/w between 1954 and 1964. Thus many ~~the~~ remarkable progress were done in the ~~so~~ technological sector.

"One must positively and negatively weight the importance of development and should involve sincerely in its development. If used effectively, technology will be a boon to society and it could ~~make~~ smart generations"
