Artificial Intelligence and ethics...

We are in the phase of the 21st century. This century is also known as the period for growing in the technological areas. Humans doing their job with the knowledge, arithmetic operations, logical operations etc. The most relevant question of this stage that we are facing today is "Can't we use artificial intelligence instead of humans in the working areas?" We can make the program for the job and it can be inserted into it. This will be very helpful and the jobs would be very easy. Every country in the world are trying to achieve the technological growth. Because years after, we can predict that the life of Homo sapiens on the earth. Day's passing, the environment is destructing. Human's can't live without a proper surrounding. That is why, the technology

attaining more importance. The growth of the technology started in 1990's. It is the wide area, so the researches are still continuing. In this time the technology gave more importance to the 'artificial intelligence'. Because it have more efficiency when compared to the humans and it has lot of advantages and disadvantages.

When we look into the stream of artificial intelligence, basically it is a robot with lot of abilities. Robots have the same structure of humans and it can talk like a perfect human being. By introducing the artificial intelligence in the working areas, they do the jobs perfectly without any errors and it takes less time when we compared to men. In the foreign countries such as Qatar, Beherin, Malaysia, Singapore etc. they are using the new technology. Most of the jobs like cleaning, data entry, programmings, software development are done by

the artificial intelligence. In India, the introduction of the artificial intelligence are started and our country is a developing country. According to the NEP (National Education Policy) in India, our country will be fully digitalized in 2030. The policy also defines that the introduction of AI would be a greater achievement for our nation. In India AI can be introduced in three levels. The Union level, state level and contraspective level of Indian constitution.

By looking the growth of digitalized country is increasing day by day. According to the NCF (National Curriculum Framework) the artificial intelligence is used in the education sectors also. The discussing regarding this is still continuing. The structure of the NCF (National Curriculum Framework) is that when a child is born it must be registered in the system with the folder 'My student'. When the child is

taken into the school, his/her academic details and the skills are marked in the folder. This academic progress is called holistic academic progress. In that folder his/her health conditions are also marked. By growing the child, he/she can find their skill and career with the help of the artificial intelligence. It also records the diseases of that person and it helps him/her to take precautions from that disease. It can approximately calculate a life span of a human in the world. By education the children are become more intelligent because the children's all doubts can be clarified by the artificial intelligence.

The artificial intelligence in the field of the medicine and engineering, it can contribute a lot of things. In the field of engineering the working of the machines and its repairing are mostly done by the AI. If we want to draw a plan for house for with small area

a perfect sketch is drawn by the AI better than human's do. In the field of medicines the contribution of AI is outstanding during the pandemic situations. On that time the temperature is measured by them and they gave the medicines to the patients. In some countries some AI's are work as a doctor.

With the help of the artificial intelligence India and other nations achieved a lot of things. The most golden moment of India is the 23rd September 2023 because of the 'Chandrayan'. The Chandrayan has landed on the south part of the moon name as 'Shiva Shakti'. Also another achievement of India is the 'Adhithya'.

In 6th January 2024 it reached halo orbit of the sun. And it stand there for 5 years to study about moon. Then the India came in the 4th country which successfully send a satellite in to the sun. The biggest achievement of human

is, we can be connected. Most of the works are done by them.

When we look into the another side of the artificial intelligence, it had a lot of disadvantage stages. According to Newton's third law "for every action, there is an equal and opposite reactions". The opposite reactions are simply said as the negative side of the artificial intelligence. According to the post structural critic, the Jacques Derrida one topic can be interpreted in different ways. The different interpretations give new ways of thinking and it is said in his law of deconstruction. As well as the activity of the AI can be interpreted in different ways. If we introduce the artificial intelligence in the field of education, the children will be grow in high level of thinking and they become more intelligent than the normal ones. But the importance of education is "character building". But when AI

taken the class, the proper character development is not possible in children. As Gandhiji said "The ultimate aim of the education is character building". That is why, the Abraham Lichon called the education is the most powerful weapon in the world. As the Christine Lagarde (the founder of IMF) said in her speech "education is the foundation upon which any change is built" and it is essential in the developing world. The children's character doesn't developed well, the country didn't be developed.

The introduction of AI's in the jobs, most of the humans become unemployment and it leads to poverty and conflict. Today the careers are selected with the help of career aptitude test, sometimes this test will not help us to identify our true potential and ability. By doing the programs the small errors are also occurred.

The important thing is that the artificial intelligence do not bother us more about our environment. But it is essential for the homo sapiens and other organisms that live in the earth. The first African Nobel prize winner "Waangai Maathai" said in her Nobel prize acceptance speech: "It is our duty to restore the nature and we must carefully give to the upcoming generations. In this time we are only focusing to the development and not considering our surroundings. Also the introduction of AI make humans more lazier.

Every problems have solutions. So there are lot of solutions for the problems faced by the artificial intelligence. As we are introducing the AI's to do job, the unemployment increases and the per capita income of a country decreases. Every jobs cannot be done by the humans. Risk jobs are there. Some of the risk jobs are life threatening.

So that kind of jobs are given to the AI's the death rate can be reduced. In the field of education, the complete academics cannot be control the AI alone. It have some defects. The education system can be divided into two. One of portion can be controlled by AI and other can control the human. Then we can develop a generation with good character and intelligence. There is a suggestion given by the technology side is that. If we give the emotions to the AI, it can be completely turned into a human. But sometimes it results in the death of the human beings. So that way is not completely possible.

The field of medicine and engineering the most of the jobs must be done by the humans and the others by AI. Like during pandemic situations (we faced COVID-19) we can use the AI and for the hospital cleaning etc.

Also the artificial intelligence donot have the ability to think like humans. It can act as a machine according to our instructions. If any instruction is given as wrong, or any mistake is come when manufacturing, it results in huge problems. sometimes it can't be suitable to our ethics. There are examples for it the robot killed patients and the people and sometimes it is aggressive.

We are here in the technological era, if we do all the technological for humans and the environment without any selfishness everything will result in a good way. There is an idea in the story "light on the hills" is "if you want to do anything you should do it for the people that you love". When we do all the things without selfishness and greedy all will be ended in a nice

way, Humans are the most blessed organism in the universe with the knowledge to discriminate the right and wrong. Surely, if we all gather to and decided to do good for our country, it will be great development in every fields; especially in the field of the "artificial intelligent" and it must be suited for our ethics. There is a quote said by Helen Keller "Optimism and faith leads to success." If we look everything with good perspective, everything will be favorable.
