

## Artificial Intelligence and Ethics

### Introduction

Artificial Intelligence, referred to as AI, the fertile and unyielding branch of, the great mother Technology. Technology was made available to humans, in the form of "miniature world" called mobile phones, which could be held in our palms, Internet, the trusty servant and crooked master etc. Artificial Intelligence is the most advanced form of technology and still is getting tailored. As per the year 2023, there was a rise of users who use AI to make songs with the vocal of celebrities, they adore, AI which help the people to know their way during travelling etc.

Siri, Google Assistant are the narrators of the story named AI and its scopes

AI, Why, and Why now?

Artificial Intelligence was more familiar to people by 2008.

Artificial Intelligence is not an uninvited guest to the society of people with brain and flesh. It always existed, and came into existence with a loud proclamation. Technology never stops to mesmerize and threaten, its users in such an obstinate way. "God, when creating man, misunderstood his abilities" Just like the great Wilde said, man always tried to exceed his limitations and considered those limitations as jumps he can't explain. With his voluminous, monstrous yet enthralling views and aspects, he shaped machines and technology to do what he does, and he succeeded in it. It's yet another victory in the bag of "unique flavours". Technology developed as man wanted more advanced ways to make his work done. At last, technology exceeded the limits and gave birth to two illegitimate, ~~unlovable~~ and spoiled sprouts, AI and Machine learning (ML). Artificial Intelligence became more p.

Familiar to people as "JARVIS", the AI of Elon Musk, that was mentioned in film series "JARVIS" and "EDITH", "SERIE" became more adjacent towards humanity, inevitably leading to humanity and AI or technology becoming equals. AI has a great leap of success in technology trait, as it calculate and do work in a faster way any normal human brain tissue can do. As its connected to the "garden of Internet", its sufficiently irrigated with works and jobs which were meant for humans. Just a call, like "hey serie, what's my schedule today?". It will answer it in its automated voice with no empathy. "Science is not emotional". The quote of the great Oscar Wilde is very apt here. AI is made available to people through phones as an assistant to make note of their daily schedule or answering their questions, by a quick swivel through Internet. Our needs are satisfied in a dew of time in its most advanced way.

Ethics and aspects - The unreliable narrators.

"Technology is far more humanized than humanity and it's obvious that technology succeeds humanity." As a scientist and a believer of truths based on facts, maybe Einstein never really threatened the outgrowth of technology through his quote. It's more of a ~~man~~ danger sign. The ethical aspect of technology, born from the unholy amalgamation of ideas and needs of humans can't be unfolded that easily. It takes a thorough analysis and mechanisms to understand the ethics of technology or to be more specific AI.

AI was created as a crutch to help the people to ease their works, but as always such an innovation was out of human hands. It's his greatest tragedy. To watch the thing he carried eating his whole self, bit by bit, like being the unreliable narrator of his own story.

.. Technology was developed with the sole aim to flourish human kind. To support it, to emphasize it. To ~~pe~~ exasperate it to produce more of this kind. . . . .  
But most of them are being abused and is used for one's own merit by betraying others, privacy. The ethical aspect of Technology is to protect the privacy of user. "Technology gave us access to everything, also it gave everything access to us" the words of ~~Jan~~ James Veitch really rings a bell here. Through, technology, the user washes away his private information to others cascaded with numbers and digits. The user, which is us, may never know, if it's seized or not. But the "fishermen of technology" short formed as "hackers" may hack our information to use it for their own advantage, making us the vulnerable prey naked to the world, mutilated and robbed out of the prey's privacy.

Technology is a beehive which consists of different users, collecting and storing their information and numbers. The ethics of technology must cover these information and allow the user to have a secure data collection, and keeps the user's device from getting viruses or insecurity measures.

### The merits along with demerits

AI, the automated human being with no flesh and bone, no feelings, no empathy just a mechanical voice encoded with a wide range of world wide information. The physical or biological intelligence of man never knew any limitations, but it was showed great tardiness and corroded memories. According to Bryan Fuller "Memory is immortal", such as memory lead to a more evolved form of human beings with just the brain known as AI (artificial intelligence):

It appeared to man as a wisdom, with energy to travel great frequencies and wavelengths,

just to ensure it's matter is well. But the question, of the rhetoric variety still exists, "was it ever enough?" or "was it uncontrollable?" The answer of the unbearably unbearable fact is yes. It was.....

..... AI, formulated by Elon Musk, was far more accepted worldwide. It had it. has its merits and the dark demerit. Technology was always out of man's grasp. ~~With all his~~ AI was a boon to cyber spaces and cyber security. But the two faced and sharpened tool couldn't be beared. It was untamed. AI was misused and the strike was so horrible that Nations were stopped:.....

..... The PEGASUS created by NSO group of Israelis was feeded into the mobile phone and later, it could completely take control of its entire functions, which enabled the robbing of human rights. The Blue whale game prepared by philipp a Russ 22- year old phil Russian boy named philipp was responsible for the deaths of many innocents

Quoting Philip; "I will clean this entire society by removing the weak". Well, those people weak... No, they were manipulated and was lead to death, suicide.

AI is also misused in the form of robbing its men out of their privacy. Examples are Malware, which is a harmful software, phishing, ransomware, which lock the men and only free them when they're able to pay a ransom and the cyber attacks or technological abuses of people, who are ready to rob us and our privacy. The Movie "Who am I?" clearly depicts the neo-human kind, which is an amalgamation of amalgamation of robots and man. The robots which we believed would never turn against us was made to turn against us. An AI was responsible for such a gruesome act. The story depicts, Will Smith as a police officer who is against such a society but at last saves that society.

## Artificial Intelligence - The Next chapter and Commere

Artificial Intelligence is being modified day to day now.

The most suitable term would be, it's made more humane now. Just like the Google assistant in our phone, the A.I's are becoming more than just a voice. It's also a way of making money, capital, and more importantly a way of life.

The social media, the insolent sibling of technology is filled with AI cover songs. The YouTube, is being fed with 300 AI covers per hour (as per records). The songs are fabricated with the help of AI generator and a new song is formed with the liked singer, which is far better than original. Not just AI cover songs, stories, movies, voice covers, dialogues are said by their own adored one. Who ever thought, times would change like this. "Find a way or make a one." Hannibal the Great was right even though he

disintegrated ages ago. . . . .  
Not just songs, but also pictures are  
also changed with the help of AI's. Just put the  
words of your choice, as definition of what you  
want and freely generate the 'pic' you need.  
We don't need picasso or brush, paint, or a  
canvas anymore. We just need AI's which make our  
life simple and rather enjoyable. Videos can also  
be created with our choice and preferences of  
characters. . . . .

All such good things are always facaded with  
rotting. lies and cancers, tumour etc. "If you play,  
you must pay dearly". All such innovations are  
abused with fake voice cover or fake voice or  
conversations, which are mainly targetted on politicians,  
movie stars and celebs. AI or the main branch,  
technology has the ability to give us a collection of  
scam and those scam reminds us that the past  
and the deception was real: . . . . .

Automated number and downfall of humanity.

Automated number and human ethics limited ethics.

"Humans create more than they need and suffer from the more they never created". AI was formulated on basic ethics, that it should not interfere with the user's privacy. Other than being a carrier for their numbers. AI is not based up on emotional logics but standard scientific logics. It's a group of formats, numbers and codes with the ultimate duty to serve humans and wait upon their call. But what we created is not humane, it's merely numbers and codes which travel faster than light years to specifically search for the information stored and carrying them back to the users, to remind them of their life. As a whole, AI reminds humans, that they've a life, in a literal meaning. The ethics and facts about AI's are not

stored or encompassed in the walls of human codes or numbers. I-I's flourishing and enhancing factor. Factor which is more than which the bacterial cells can divide. Even without such codes or numbers, AI's are born naturally out of the already existing algorithms. Many have reported that new AI's are developing within the format, with new algorithms, which makes them to act as a active, free one. But such rapid mutations cannot be controlled by the basic ethics they were built upon. Such mutant mutations and development can lead to the breaking of rules and ethics and coagulating users' privacy and making them public. Even the sun set and the flowers will die, like that AI will leave their most formulated form and may form something that's out of our hands, which are only made of blood, bones and flesh and is fragile.

## Conclusion

The "toy friend of man, the AI, the canopy of technology", the "cherish cat of knowledge, the unbearable mass of destruction", was developed by the "Hu-mans" ~~it~~ themselves, to simplify their life and needs. The ~~words~~ <sup>number</sup> are the most raw and desperate ones, and they're dangerously unpredictable. With all of man's knowledge and intrusion, he could not entirely predict the flourishing of AI. He can always care for the caterpillar, whisper through the chrysalis, but what hatches follows its own nature and it's beyond man. Such uncontrolled mutation or abuse of AI or technology can lead to disturbances in the defense mechanism of nations, which will break out war, and entirely destroy each other. The basic ethics of AI is to conserve / secure user privacy. But ~~AI~~ ~~is~~ ~~has~~ the habit of. The user must also have a reverence towards it and allow it to fertilize not to accumulate
